Ingestion Models

There are multiple ingestion models in GDP

1. If you are using a non AWS Environment : Request for an IAM User. You will receive your access keys and secret access keys over email and phone number. Request GDP Support team with the following details – Name suffix in the user to identify your project, a folder in the Inbound S3 bukcet.

Optionally, you can also request for an IAM Role Anywhere approach where you can bring your own Certificate.

2. If your data is within AWS, then choose an IAM Role based approach. In this approach a GDP IAM Role will be created that will trust your role. Request for this model with the GDP Support team along with the following information – your role arn, the S3 folder path to which you require access to and a passphrase(External ID) you'll use while assuming the role.

3. If your data is in an SFTP Server, then the best option is to choose for SFTP file transfer. Request the GDP Support team to create an SFTP Server and a user. The required details are, Name suffix for the server, Name suffix for the user, the S3 folder path and the method of authentication – namely, Key pair based, Password based.
